

Conductive Ceramics: Embedding Electronics in Everyday Ceramic Objects

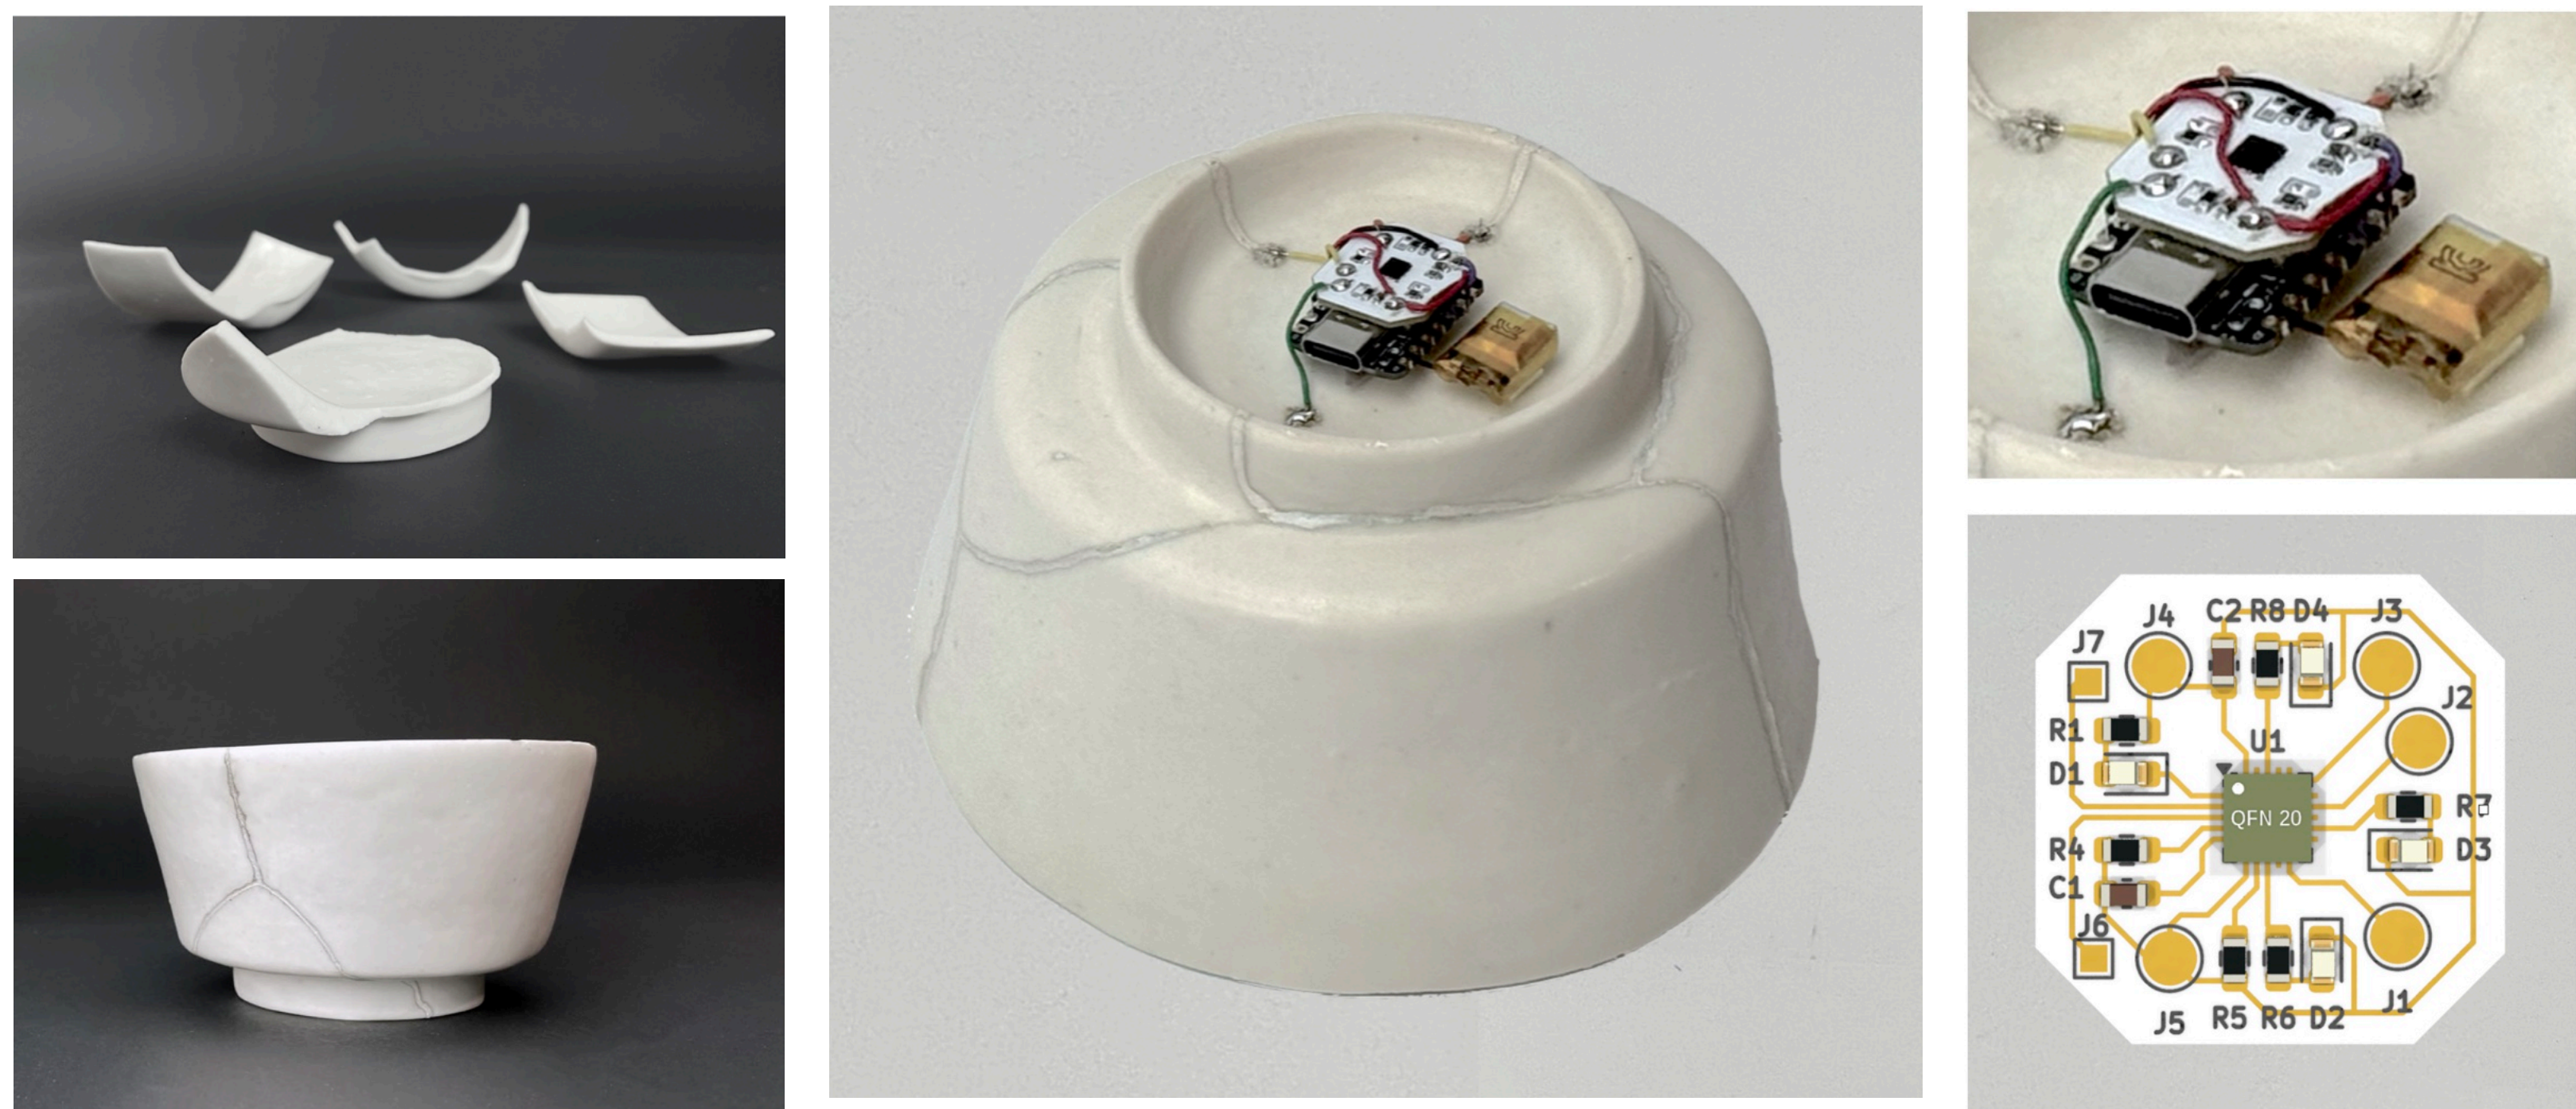

CONTRIBUTION

We present a method for **integrating conductive traces** into ceramic objects **using a silver-based glaze** that combines silver powder with a glass former and xanthan gum.

APPLICATIONS

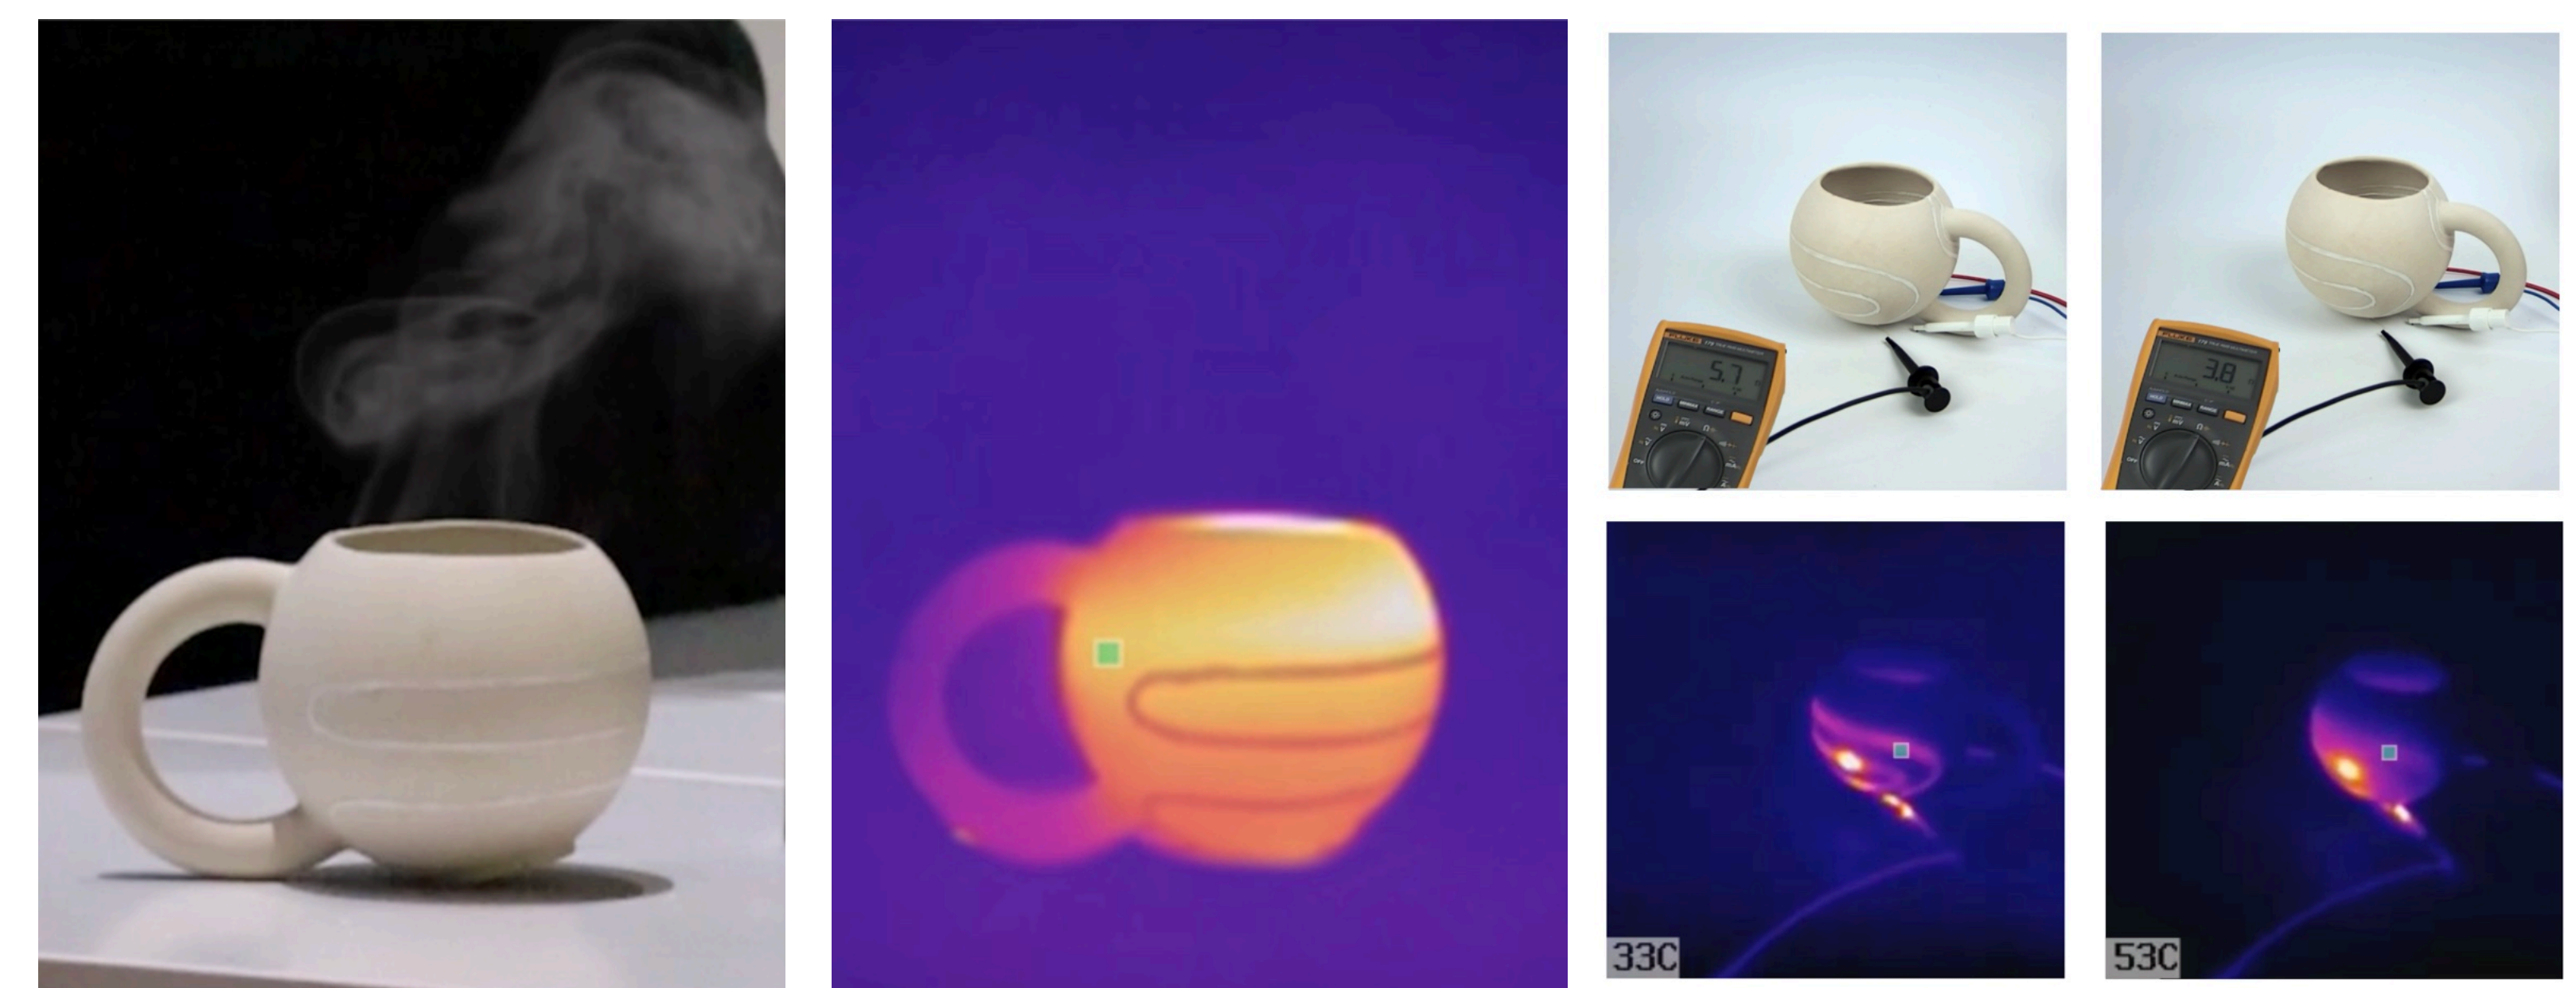

KINTSUGI MUSICAL CONTROLLER

The conductive glaze is used in a kintsugi-style repair create touch-sensitive triggers for musical interaction using capacitive sensing.

SMART CERAMIC CUP

We use a combination of resistive heating and sensing to create a cup that is able to heat itself and sense its own temperature

BENEFITS OF APPROACH:

- Preserves the **functionality** and durability of conventional ceramics
- Aligns with **established** pottery techniques & workflows
- Remains **accessible** to practitioners in community studios

INTERACTIVE MARBLE MACHINE SCULPTURE

This object uses conductive traces painted with silver glaze to illuminate LEDs as a metal marble connects the circuit as it rolls down the track.
